

Bugs

5/20/2014

When students logged into Lourdes' computer while conducting interviews, they could not immediately access their microscopy data from previously saved experiments. The last sample that they had click on was visible, but if you tried to click on any of the other samples without waiting for several minutes, a black screen came up. Then one needed to wait a long, long time (maybe 10-15 minutes) for the data to load for those other samples. If instead, one waited several minutes before clicking on the other samples, then you were able to see them.

When students logged into Lourdes' computer while conducting interviews, they could not easily set up a new microscopy analysis of previously saved experiment. The green dot within the radial buttons in the Microscopy set up page was missing. You can still select conditions to apply, but you could not see what was being selected.
